1. Introduction

1.1. Purpose of the report

The report is written by Stewart Bradshaw for Lisa Williams. Stewart completed a Preliminary Roost Assessment of Holm Lea, Church Street, Holt, on 15th May 2023.

1.2. Survey aims

The aim of the survey was to determine the actual or potential presence of bats and the need for further survey or mitigation.

1.3. Surveyor details

Stewart is licensed to disturb, take and handle all species of bats (with the exception of greater & lesser horseshoe bats) in all counties of Wales under licence number SO87045/1. He has more than 10 years of experience in ecological consultancy, including the planning & preparation of bat surveys, and mitigation licences.

1.4. Reason for survey

The development proposals are for the extension of the property including a full height rear extension, works to the roof, and changes to the internal layout.

1.5. Site context

The house is located on Church Street, Holt, Wrexham, GR SJ 41145 54045; approximately 8km northeast of Wrexham City Centre. The house is close the edge of the village, surrounded by houses and gardens, with The River Dee, and open countryside to the east.

The site includes a pre-1950's end-terrace house, which was occupied until recently, with gardens to the front and rear, and areas of hard landscaping.

Habitat within 50m of the house includes; houses, gardens, small areas of open green-space, and well-lit roads.

Habitat within 500m includes, housing and linked back gardens, areas of open green-space, watercourses and mature trees.

The house is on Church Street which forms the main access road into, and out of, the village; and is subject to a level of disturbance from light and noise.

Habitats in the immediate surrounding area provide low quality foraging, commuting, and roosting opportunities for bats.

Higher quality habitats are available to the west, along The River Dee, and in the surrounding farmland.

1.6. Site location

1.6a – Holm Lea, Holt – site location.

1.6b – Holm Lea, Holt – aerial photograph.

2. Methods

2.1. Survey timings

The survey was completed on 15th May 2023. Weather conditions during the survey were bright, warm, and dry, with a temperature of 18°C.

2.2. Desk study

No desk study of the site was undertaken, prior to the preliminary roost assessment, and no other ecological surveys have been carried out in relation to the proposals.

The development has a small footprint, and impacts beyond the site boundary are unlikely. A site-specific investigation was considered more suitable.

2.3. Habitat assessment

The habitat on site and in the surrounding area was assessed using Ordinance Survey mapping, and aerial photography. Habitat features on site, and those in the surrounding area were assessed for their suitability for use by bats during the site visit.

2.4. Building inspection

A systematic search of the exterior of the building was made to identify potential or actual bat access points and roosting places, and to locate any evidence of bats such as live or dead specimens, bat droppings, urine splashes, fur-oil staining and or squeaking noises. Bat specimens and droppings are the most reliable type of evidence; the other types are not always the result of bat activity. Sometimes bats leave no visible sign of their presence on the outside of a building (even when they do wet weather can wash evidence away.)

The search included (where present) the ground beneath potential access points, windowsills, window panes, walls, behind peeling paintwork and lifted rendering, hanging tiles, weatherboarding, eaves, soffit boxes, fascia's, lead flashing, gaps under felt, under tiles / slates and in existing bats boxes. Gaps in brickwork and stonework were searched (where present). All evidence of use by bats, or features with the potential to be used by bats was recorded and photographed.

A systematic search of the inside of the building was undertaken to identify potential or actual bat access points and roosting places, and to locate evidence of bats. Bat specimens (live or dead) and droppings are the most reliable type of evidence. Other evidence can include urine splashes, fur-oil staining, feeding remains, squeaking noises, bat fly (Nycteribiid) pupal cases (Hutson 1984) or odour.

Areas inspected include;

Within rooms

- floors and surfaces
- behind wooden panelling
- in lintels above doors and windows
- behind window shutters and curtains
- behind pictures, posters, furniture, peeling paintwork, peeling wallpaper, lifted plaster and boarded up windows
- inside cupboards and in chimneys accessible from fireplaces.

Within roof spaces

- the tops of gable end and dividing walls
- the top of chimney breasts
- ridge and hip beams and other structural timbers
- mortise and tenon joints
- all beams
- the junction of roof timbers, especially where ridge and hip beams meet
- behind purlins
- between tiles and the roof lining (where accessible)
- under flat felt roofs.

The areas listed above were inspected (where present), any additional areas with potential for use were also inspected.

2.5. Equipment

The equipment listed below was available for use during the surveys and was used where required.

Clulite CB2 1,000,000 candlepower torch. Rigid Seesnake CA-300 digital endoscope with 0.9m cable reach with 17mm and 6mm imaging heads. Digital camera with 50x zoom. 8x25 close focussing binoculars, 4m ladders, bat handling gloves, DNA sampling tubes.

2.6. Survey limitations

None. All areas of the house were inspected in detail. The survey was completed in May, when bats are active, and external signs of use, such as droppings, are more likely to be evident, if present.

3. Results

3.1. External inspection

3.1a – The front of the house.

Holm Lea, Church Street, Holt, is a pre-1950's end-terraced house, which was occupied until recently. It has a pitched roof, covered with plain clay roof tiles, and ceramic ridge tiles. A dormer at the front of the house has a flat felt-covered roof. There is a UPVC and glass conservatory to the rear.

Roof pitches face north, south, east, and west, the gable end faces south. Lead flashing is fitted to the base of chimneys, above bay windows at the front of the house, and where roof tiles abut brickwork. Timber fascia boards and boxed soffits are fitted at the eaves. Walls are solid brick with no insulating cavity, covered with a white painted cement render. Lintels are brick, sills are timber and UPVC; window and door frames are a mixture of timber and UPVC, all glass is intact.

The building is well maintained, and in good condition. Ridge tiles are fixed tightly, there are no damaged or missing ridge tiles. There are two slipped roof tiles at the front of the house; however, the back of the tiles are intact, and there are no gaps which could be used by roosting bats.

There are no other damaged, slipped, or missing roof tiles. Roof tiles are tightly fitted, with no gaps between tiles. Timber fascia boards and boxed soffits are fitted tightly against the walls gaps are filled with sealant. Walls are in good condition, with no missing mortar or cracks.

There are no features externally which are likely be used by roosting bats, and no evidence of use by bats was present during the inspection.

3.2. Internal inspection

3.2a – The roof void.

The house has a single roof void, which was used for storage, and accessed infrequently for essential maintenance.

The roof has a timber rafter and purlin structure, lined with bitumen felt, and insulated with mineral wool between the ceiling joists. The roof lining is in good condition with no tears, or gaps.

The wall plate and eaves inspected using an endoscope. There are no gaps at the wall-plate; and there are no gaps which give direct access to the roof void from the outside. Boxed soffits open into the roof void and were inspected from above.

The small gaps between roofing materials, timbers, and brickwork at the gable end were inspected using an endoscope. These areas are dusty and cobwebbed, and no gaps, or indications of use by bats were present.

The house has no cellar, and there are no other enclosed spaces which are suitable to be used by roosting bats.

3.3. Indications of use

No indications of use by bats was present during the survey, either internally, or externally.

3.4. Level of suitability

The house has **negligible suitability** for use by roosting bats. This is as the building is well maintained, in good condition, and as no suitable roosting opportunities were noted during the building inspection.

4. Evaluation

The building is set in an area which, in general, provides low quality habitat, for foraging, commuting and roosting bats, although bats are likely to be present locally.

The River Dee, areas of open farmland, and linked back gardens locally provide foraging opportunities for bats, in an area which is subject to little fragmentation, or light and noise disturbance.

Houses immediately adjacent to good quality habitat are more likely to be used by roosting bats than those further away. However, the house is well-sealed, and has no features which could be used by roosting bats.

The village is subject to some limited disturbance from light, traffic, noise, and other human activity. And this is likely to reduce the level of bat activity within the village, compared to the surrounding areas of open, undisturbed habitat.

The house is well maintained, and in good condition. There are no features externally, which are suitable, or likely to be used by roosting bats; the roof void has no gaps which could give direct access to roosting bats, and no evidence of use was found during the inspection.

The lack of any indications of use inside the roof void, such as bat droppings or feeding remains, reduces the likelihood of a significant roost being present. If bats were present inside the roof void, even in lower numbers, some evidence of use would be likely to persist.

Roof and ridge tiles are in good condition; ridge tiles are sealed with cement. There are no gaps between roofing materials which could be used by roosting bats.

Walls are solid brick with no insulating cavity. Walls and render are in good condition, with no cracks, or missing mortar which could be used by crevice dwelling bats.

Window and door frames are fixed into the brickwork, gaps are filled with sealant, and offer no suitable roosting opportunities.

Timber fascia boards and boxed soffits at the eaves are fixed tightly against brickwork, with no suitable gaps; boxed soffits open into the roof void, and were inspected from above.

The small gaps between brickwork, roof timbers, and roofing materials, in the roof void were inspected in detail using an endoscope. No droppings were found, and no suitable gaps were present which could give access, or shelter to roosting bats.

Taking into account the habitat surrounding the site, and the features present, the buildings are unlikely to be used by roosting bats and have **negligible suitability** for use.

4.1. Legal and planning context

All species of bats in the UK and their roosts are legally protected by UK and European legislation. The UK the legal protection is summarised as follows:

You will be committing a criminal offence if you:

1. Deliberately* capture, injure or kill a bat
2. Intentionally or recklessly disturb a bat in its roost or deliberately disturb a group of bats
3. Damage or destroy a bat roosting place (even if bats are not occupying the roost at the time)
4. Possess or advertise/sell/exchange a bat (dead or alive) or any part of a bat

5. Intentionally or recklessly obstruct access to a bat roost even if bats are not present at the time

*In a court, 'deliberately' will probably be interpreted as someone who, although not intending to capture/injure or kill a bat, performed the relevant action, being sufficiently informed and aware of the consequence his/her action would most likely have.

5. Impact assessment

The development proposals are for the extension of the property including a full height rear extension, works to the roof, and changes to the internal layout.

The building has no features which are suitable, or likely to be used by roosting bats and has negligible suitability for use.

The proposed work is unlikely to impact on bats or bat roosts; and, once completed is unlikely to provide any increase in levels of disturbance for bats locally.

6. Required actions

The building has **negligible suitability** for use by roosting bats, no field signs of use by bats were found internally or externally during the inspection, and no further survey work is required.

8. Appendix 1 – Photographs

1 – The front of the house.

2 – The rear of the house.

3– Roof and ridge tiles are in good condition with no suitable gaps.

4 – Two slipped tiles at the front of the house do not provide access for roosting bats.

5 – Lead flashing is fitted tightly with no suitable gaps.

6 – Cement at the gable end verges is intact, with no suitable gaps.

7 – There are no gaps between boxed soffits and render at the eaves.

8 – Window and door frames are tightly sealed into brickwork with no suitable gaps.

9 – The house has a single roof void which is not used for storage.

10 – Roof lining is in good condition timbers are covered in cobwebs.
