1 INTRODUCTION

1.1 The Scheme

1.1.1 Etive Ecology was commissioned by Caulmert Ltd to prepare a Preliminary Ecological Appraisal (PEA) for a plot of land off Bridge Road North, Wrexham, LL13 9XQ. The initial survey was undertaken on 14th February 2022. The application site is centred on National Grid Reference SJ 38293 49917.

1.1.2 The PEA is to inform a proposed development comprising a storage and distribution unit, with the required access, turning circle and car parking spaces.

1.2 Scope of this Report

1.2.1 The ecological appraisal of the proposed scheme is broadly based upon the *Guidelines for Preliminary Ecological Appraisal* (Chartered Institute of Ecology and Environmental Management, 2017).

1.2.2 The aim of the assessment is to obtain information on the existing ecological composition and value of the site, and to conduct a preliminary assessment of the likely significance of ecological impacts. To achieve this, the following steps were taken:

- The field survey area and the 'zone of influence' of the scheme, have been identified
- A desk study has been undertaken, including the purchase of records from the local record centre; Cofnod.
- Baseline information on the site and surrounding area has been recorded through an 'extended Phase 1 survey', including a Phase 1 habitat survey (JNCC 2010) and consideration of notable and/or protected habitats and species (IEA 1995)
- The ecological features found to be present have been evaluated (CIEEM, 2019)
- Invasive plant and animal species (such as those listed on Schedule 9 of the Wildlife & Countryside Act [WCA]) have been identified
- Potential constraints to the proposed development and potentially significant ecological impacts have been identified
- Recommendations for further survey have been made, where appropriate
- Mitigation recommendations have been provided based on current information.

1.2.3 A Phase 1 Habitat Map of the survey area is presented in **Appendix A**. Target notes are marked on the Phase 1 Habitat Map and are used to link the report text to locations on site. Photographs taken during the survey and target notes are presented in **Appendix B**. The biological records obtained for the scheme are presented in **Appendix C**.

1.2.4 Following the initial site survey, a couple of trees were identified with bat roost potential. Further bat surveys on these trees were added to the scope of the ecological appraisal.

2 METHODOLOGY

2.1 Desk Study

2.1.1 A desk study was undertaken to identify any nature conservation sites within 2km of the proposed site. The desk-based exercise also considered the potential for protected and/or notable species of fauna to be found within 1km of the proposed site.

2.1.2 The following sources of information were utilized:

- MAGIC website (<http://www.magic.gov.uk/MagicMap.aspx>)
- Wrexham County Borough Council website (<http://www.wrexham.gov.uk>)
- Natural Resources Wales website (<https://naturalresources.wales/>)
- Wales Biodiversity Partnership (<https://www.biodiversitywales.org.uk/>)

2.1.3 A data request was made to the North Wales Environmental Information Service (COFNOD), for records of all legally protected and priority species within 1km of the site boundary. The enquiry also included a search for nationally or locally designated nature conservation sites.

2.2 Extended Phase 1 Habitat Survey

2.2.1 The initial site visit was undertaken on 14th February 2022.

2.2.2 The survey comprised an extended Phase 1 Habitat Survey. This survey method follows the habitat assessment and classification procedure outlined by the Handbook for Phase 1 Habitat Survey (JNCC, 2010), whereby all habitats are identified, described and mapped using a standard classification.

2.2.3 The extended component of the survey is developed from the methodology described in Guidelines for Baseline Ecological Assessment (IEA, 1995). All habitats and features within the survey area are assessed for their potential to support legally protected or notable species (nationally or locally).

2.2.4 These species include:

- **Amphibians:** ponds within 250m of the site were considered for their suitability to support a range of amphibians, including great crested newts (GCN).
- **Bats:** all trees and structures on site were assessed as to their suitability to support roosting bats at any point during the year. Trees and structures were then categorised for their potential to support roosting bats as per the *Bat Surveys for Professional Ecologists – Good Practice Guidelines* (Collins, J., 2016).
- **Birds:** the site was assessed for suitable habitats for nesting birds, including habitats suitable for ground-nesting species.
- **Badgers:** all habitats within 30m of the site were surveyed where possible to identify the presence of any setts or signs of badger activity.
- **Riparian mammals;** watercourses within 100m of the site were checked for signs of otter and water vole and assessed for their suitability to support the species.
- **Reptiles:** the site was assessed for suitable habitats including grassland, habitat edges and suitable refuge areas in general which would provide cover, basking and foraging habitat for reptile species.

- **Invasive plant species:** this assessment does not constitute a full Schedule 9 species survey. The potential for any Schedule 9 species was assessed and any species that were encountered were mapped and noted.

2.3 Bat Detector Surveys

- 2.3.1 Bat surveys were undertaken in full accordance with the guidance set out by Collins, J. (ed.) (2016). This includes a determination of survey effort based on the value of any given feature for roosting bats. During the scoping appraisal two mature oak trees on site were identified to have Low Bat Roost Potential (BRP) and required a single bat detector survey each, to be carried during the active season.
- 2.3.2 The locations of the trees and the red line site boundary (approximate) are shown in Plate 2.3.1 below. Surveyors were positioned to the north and south of each tree. Survey dates and weather conditions were recorded and are provided within the Results section.

Plate 2.3.1 Bat Survey Details

- 2.3.3 Dusk surveys commenced 15 minutes prior to sunset and ceased not earlier than 90 minutes following sunset, when survey conditions were too dark for the surveyor to accurately and definitively identify bat emergence and flight.
- 2.3.4 The surveyors were all using EchoMeter Touch bat detectors. Bat activity was recorded and analysed using Kaleidoscope software.

2.4 Assessment of Ecological Value

- 2.4.1 The value and sensitivity of ecological features was determined based on the guidance given in *Guidelines on Ecological Impact Assessment* (CIEEM, 2019). Individual ecological receptors

(habitats and species that could be affected by the development) were assigned levels of importance for nature conservation in one of the following categories:

- International
- UK
- National
- County
- District;
- Local, or
- within the immediate zone of influence or site only.

2.4.2 For a given receptor, determination of value includes consideration of the size, secondary or supporting value/function, conservation status and quality of the species or feature.

2.5 Limitations

2.5.1 Access was permitted to all land within the proposed development footprint. Access beyond the site boundary was restricted but much of the adjacent land was at least visible to the surveyor.

2.5.2 The survey took place in February, which is outside of the optimal time of year for Phase 1 Habitat Survey. The results of this survey should therefore be assessed with these considerations in mind. However, the surveyor did also visit the site in July 2021 and is therefore familiar with the condition of the site vegetation during the core growing season. As the site is predominantly semi-improved grassland, it is considered that the survey effort undertaken still provides an accurate assessment of the habitats present and the ecological impact that the proposed works may have.

3 RESULTS

3.1 Desk Study

Designated Sites

- 3.1.1 There are no statutory designated sites for nature conservation located within 1km of the site:
- 3.1.2 There is one Local Wildlife Site (LWS) located within 1km of the site;
- Wrexham Industrial Estate; the LWS comprises a series of sites within the industrial estate which includes unmanaged grassland ancient broadleaved woodland. Derelict land consists of a complex mosaic of scrub, grassland and tall herb. Species- rich grassland occurs where there is rabbit grazing with cowslip, restharrow, yellowwort, common centuary and bird's-foot trefoil present. Other species of interest include dyer's greenweed, in among scrub and grass vetchling, in rank grassland. A mosaic of woodland and damp grassland occurs adjacent to the River Clywedog. These sites are located ~590m to the east, ~551m to the south and ~437m to the west of the site.
- 3.1.3 There are three blocks of Ancient Woodland located between 437m – 892m from the site noted in the Table 3.1.1.

Table 3.1.1 Ancient Woodland within 1km of the Site.

Site name	Distance from Site	Designation
Ancient woodland sites	437m	Two restored ancient woodland sites, forming one large continuous woodland area.
Ancient woodland sites	892m	One ancient semi-natural woodland.

Species Records

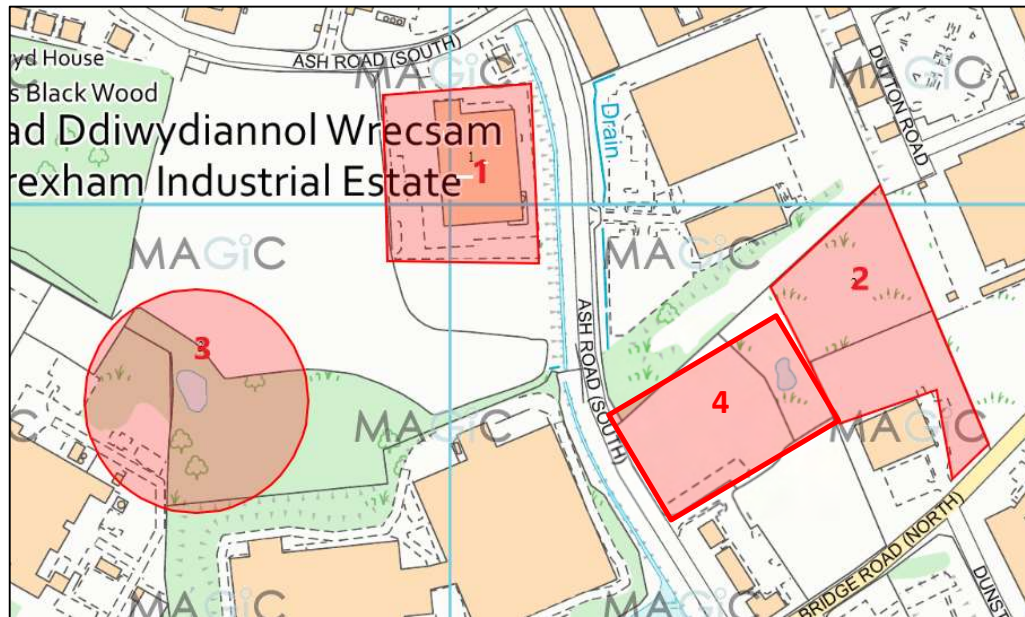

- 3.1.4 Full details of the data provided by Cofnod are given in **Appendix C**. Below is a summary of the key records by species group as provided by Cofnod:
- Amphibians; GCN, palmate newt, smooth newt, common frog, common toad.
 - Bats; Brandt's bat, daubentons bat, whiskered bat, myotis bat, noctule, common and soprano pipistrelle, brown long-eared, lesser horseshoe, and pipistrelle bat sp.
 - Birds; numerous bird species including notable species such as barn owl, bullfinch, Cetti's warbler, cuckoo, dunnock, kingfisher, kestrel and fieldfare.
 - Invertebrates; numerous invertebrate species including notable species such as grizzled skipper, latticed heath, small heath, and wall.
 - Mammals; badger, hare, hedgehog, polecat, weasel and stoat.
 - Riparian mammals; Otter
 - Reptiles; Adder, grass snake, slow worm and common lizard.

Previous Ecological Studies

- 3.1.5 A PEA was undertaken in 2015 by Enfys Ecology Ltd to support a planning application for the Village Bakery on a site which is located ~240m to the northwest of the proposed development

site¹. The survey identified three ponds <500m of the site and carried out GCN surveys of these ponds, located ~120m to the southwest of the Village Bakery site and ~467m from the proposed development site. A medium population of GCN was recorded. Newt fencing was installed, and a trapping programme was carried out under an NRW license in 2016/17. A total of 420 GCN were trapped and translocated into the woodland to the south of the site (Erlas Black Wood). This number showed that there was a large population of GCN present within the immediate area. As part of the NRW license the ponds within the woodland have been improved for the benefit of GCN and a new pond created.

Plate 3.1.1 The Village Bakery (1), Bridge Rd North Site (2), known GCN Ponds (3) & Ash Rd South Site (4)

- 3.1.6 Land immediately adjacent to the west of the Bridge Rd North site was subject to a successful planning application for commercial development. The scheme included the construction of a new warehouse, ancillary storage areas and buildings, landscaping and car parking. The scheme was designed to cover approximately two thirds of the application site area, with one third retained for ecology/GCN. The whole site was subject to GCN trapping/translocation under a GCN License and the ecology area was subject to the creation of a new pond, hibernacula creation, tree/scrub planting and 25 year post-development management.

Environment (Wales) Act 2016

- 3.1.7 Section 7 of the Act replaced the 'Biodiversity duty' in Section 40 of the Natural Environment and Rural Communities (NERC) Act 2006, which requires all public bodies to have regard to biodiversity conservation when carrying out their functions. This is commonly referred to as the 'Biodiversity duty'.
- 3.1.8 The Section 7 list is now used to identify those habitats and species of Principal Importance in Wales under the Environment (Wales) Act. The following relevant habitats and species are found on this list:

¹ Enfys (2015). Proposed New Village Bakery Site, Ash Road South, Wrexham Industrial Estate: Ecology Surveys. Produced on behalf of Village Bakery

Table 3.1.2 Relevant Section 7 Habitats/Species

Habitats	Species
Hedgerows	Hedgehog
Arable field margins	Brown hare
Lowland meadow	Polecat
Ponds	Slow worm
	Great crested newt
	Various invertebrate species
	Various bird species
	Various bat species

3.2 Extended Phase 1 Habitat Survey

- 3.2.1 The walkover survey in February 2022 was undertaken by Wendy O'Neill (BSc) of Etive Ecology. The survey was undertaken on a damp dull day with occasional rainfall with no constraints to the survey of any part of the red line application site. The earlier walkover of the site in July 2021 was undertaken by Russell Grey (MCIEEM, BSc, CEnv) of Etive Ecology.
- 3.2.2 The proposed development site is located off Bridge Road North, within Wrexham Industrial Estate, Wrexham. Demon Tweaks is located to the north of the site, Isringhausen GB to the east, Ardagh Group to the southwest of the site and Village Bakery to the northwest. Bridge Road North is located to the south of the site and joins Bridge Road which leads to the town of Wrexham to the west, via Cefn Road. The wider environment comprises the A534 ~2km to the north and the town of Wrexham ~3km to the west. The surrounding land-use is industrial in all directions for ~1km. The Rivers Clywedog and Dee are located ~943m to the south and ~3.75km to the east of the site, respectively. The OS map indicates three ponds located within 500m of the site boundary. However, it is understood from a previous ecological survey (Section 3.1.5), that there are three ponds within an area where only one pond is visible on aerial imagery.

Habitats

Grassland and Marsh

- 3.2.3 The proposed development site comprises an area of semi-improved neutral grassland dominated by perennial ryegrass with occasional patches of sedge and rushes and occasional herbs/forbs including meadow buttercup, ribwort plantain, oxeye daisy and grass hawksbeard. The grassland extends from immediately adjacent to Bridge Road (Target Note 1) northwards across the main body of the site (Target Note 2). The majority of the larger area is boggy and the grassland has been subject to regular management and maintenance.

Scrub

- 3.2.4 There are bands of scattered scrub dominated by dog rose and hawthorn, with occasional self-seeded oak, present to the southeast and southwest corners of the site (Target Notes 3 & 4). This habitat is also present within adjacent land to the north, east and west of the site.

Tall Ruderal

- 3.2.5 Tall ruderal vegetation is located along the southern half of the western boundary and around the scrub area in the southeast of the site. Creeping thistle, broad-leaved dock and willowherb are the dominant species present, with occasional bramble.

Woodland

- 3.2.6 There are two scattered broadleaved trees within the site (T1 and T2), both of which are oak trees ~10m in height, 800mm diameter at breast height and with bat roost potential (BRP). There is brash and a large tree trunk scattered around the site, which could be used by reptiles and amphibians as hibernacula.

Hedgerow

- 3.2.7 An unmanaged native species-poor hedgerow which is dominated by hawthorn and blackthorn and with limited ground flora dominated by bramble is located along the northern site boundary (Target Note 5). The hedge is ~2m in height and ~1.5m in width with a steeply sloping embankment adjacent to the north (Target Note 9).

Fence

- 3.2.8 The eastern (Target Note 6), northern and western site boundaries are comprised of a combination of timber post and rail, and metal chain-link fences.

Standing Water (Pond)

- 3.2.9 Land adjacent to the west of the site has been recently developed for commercial use. As part of the development there has been a new pond created (Target Note 7). This relatively new pond is located ~10m from the western site boundary.

Building

- 3.2.10 To the south of the application site is the existing Coolpoint operational building (Target Note 8), comprised primarily of corrugated metal panels over a steel structure, with security lighting attached to various elevations.

Hard-standing

- 3.2.11 Land to the north, south and east comprises existing industrial units and operational sites, including Isringhausen to the east (Target Note 10). These sites are surrounded by made-ground and extensive areas of hard-standing,

Protected Species

- 3.2.12 The following text summarises the suitability of the survey area to support various legally protected species, based on the descriptions provided in the text above.

Amphibians

- 3.2.13 The proposed development area does not contain any ponds. However, there are six ponds within 500m of the site. The closest pond is the newly created pond located ~10m to the west and an eDNA survey undertaken of this pond in July 2021 returned a negative result. One large ornamental pond within Redwith Tower is located ~387m to the northeast of the site, one pond is located within the Ardagh Group site ~250m to the southwest of the site and three further ponds are located within Erilas Black Wood LWS ~467m to the west of the site. The area is thought highly likely to support great crested newts, due to a population known to be present nearby. The Village Bakery, located ~240m to the northwest of the proposed

development site, has a Natural Resources Wales (NRW) development licence and surveys have confirmed a large great crested newt population size.

- 3.2.14 The terrestrial habitat present within the proposed development comprises managed semi-improved neutral grassland, field edges of tall ruderal, patches of scattered scrub and a native hedgerow, all of which are of moderate value to GCN as they offer good foraging and dispersal habitat. There is limited connectivity to the south due to the existing industrial units and Bridge Rd North, but to the north, east and west there are good habitat links for GCN and more general amphibian dispersal.
- 3.2.15 Cofnod provided >50 records of GCN, 2 records of Palmate newt, 22 smooth newt, 13 records of common frog and 8 records of common toad within 0 – 1km of the site between 1992 – 2021. The closest record of GCN was recorded in 2012, ~292m from the application site boundary.
- 3.2.16 Based on the historical records, the suitability of the terrestrial habitat on site and the known large population supported by WIE, it is concluded that GCN and other species of amphibian are likely present within the application site boundary.

Bats

- 3.2.17 There are two semi-mature broadleaved trees within the application site boundary; T1 and T2. Both are semi-mature oaks with a number of PRFs including dead limbs and natural splits within the trunk. Both trees were provisionally assessed to be of **Low Bat Roost Potential** (BRP²) and requiring at least one bat detector survey to be carried out.
- 3.2.18 A single dusk bat detector survey was carried out on each of the two oak trees on 5th May 2022. Two surveyors surveyed each tree, commencing at 15 minutes prior to sunset (20.47) and finishing 90 minutes after sunset. The weather was 15°C, 6mph westerly, dry and 10% cloud cover.
- 3.2.19 The surveyors at Tree 1 first encountered a bat at 21.11 – a noctule that was not seen but certainly did not emerge from the tree. The next bat was a common pipistrelle at 21.37 seen flying towards the tree from land adjacent to the east and continuing to fly westwards along the rear of the Coolpoint building. At 21.43 two soprano pipistrelles flew towards the tree from the northwest and continued eastwards off site. One additional soprano and one additional common pipistrelle were seen to briefly forage around the southern side of the tree before dispersing south and east. No bats were seen to emerge from Tree 1.
- 3.2.20 The surveyors at Tree 2 first encountered a bat at 21.18 – a soprano pipistrelle that was heard but not seen. At 21.25 two soprano pipistrelles flew onto site from the north, past Tree 2 and continued south towards Tree 1 (where they were observed at 21.43). One more soprano was recorded but not seen at 21.56 and a couple of faint Noctule passes were also recorded at 21.51 and 22.08. No bats were seen to emerge from Tree 2.

² **High** = trees with one or more potential roost sites suitable for use by larger numbers of bats on a more regular basis and potentially for longer periods of time. **Medium** = trees with one or more potential roost sites that could be used by bats but unlikely to support a roost of high conservation status. **Low** = trees with one or more potential roost sites that could be used by individual bats opportunistically, but are not suitable to be used on a regular basis by larger numbers of bats. **Negligible** = negligible features likely to be used by roosting bats (Collins, J., 2016).

- 3.2.21 The site as a whole is considered to be of low value as a foraging and commuting resource to bats. Although the site comprises entirely semi-natural habitats, the semi-improved grassland that dominates the site is subject to regular management. The north, east and west boundary corridors have the potential to offer foraging and commuting routes for bats, however they require some conservation management to maximize their potential. The off-site woodland and hedgerows to the west of the site offer greater value habitat for bats. Overall, the level of bat activity recorded and observed during the bat survey was considered to be very low.
- 3.2.22 Cofnod returned numerous records of bats within 298m – 1km of the site. There were seven records of common pipistrelle, two records of soprano pipistrelle, four of noctule bats, one lesser horseshoe and <5 myotis species between 1999 and 2020.
- 3.2.23 In summary, roosting bats are considered to be absent from the site and the overall foraging/commuting value is very low. The site has the potential to be enhanced in terms of its bat potential, but currently supports very little bat activity.

Birds

- 3.2.24 The opportunities for nesting birds within the proposed site boundary are limited to the northern boundary hedge and the two oak trees (T1 and T2). The adjacent scrub to the east and west of the site offer potential nesting opportunities, whilst the on-site scrub is too sparse to be of nesting value. The semi-improved grassland also offers limited foraging habitat.
- 3.2.25 Cofnod returned records for 261 bird species up to 1km from the proposed site. The closest record was for kestrel ~100m to the east of the site. During the site survey 19 snipe were disturbed from the adjacent scrub habitat to the east of the site. Overall, the site is considered to be of low value to nesting and foraging birds during the breeding season.

Badger

- 3.2.26 The semi-improved grassland that dominates the site is of relatively low value to badger and offers limited foraging value. The field margins are limited to scattered tall ruderal and scrub, also of limited value. The surrounding land comprises primarily industrial units and yards, with the woodland and hedgerows alongside Ash Road to the west offering the nearest potentially suitable habitat for badgers.
- 3.2.27 Cofnod returned seven records for badger within 1km of the proposed development. The closest record was ~500m to the west of the site, within Black Wood LWS (2016). There were no badger setts encountered <30m of the site boundary and there were no field signs of foraging badgers.
- 3.2.28 Based on the historical records, the suitability of terrestrial habitat on site and the lack of field signs, the site is considered unsuitable to support badgers. It is concluded that badgers are likely absent from the site and land <30m.

Riparian Mammals

- 3.2.29 There are no main water-courses, ditches or drains within the application site boundary. The closest aquatic features with potential suitability for otter are the network of ditches located to the west of Ash Road South (170m from site). The habitats on site lack suitable vegetation cover and shelter to be suitable for holts or lying-up sites. No signs of any riparian mammals

were found within the proposed site boundary during the walkover survey. The River Clywedog is located ~940m to the south of the site, and the broadleaved woodland adjacent to the river is more likely to provide suitable resting places and holts.

- 3.2.30 Otter have been recorded within the WIE, but since their range is so large, it is likely that they simply move through the area. Cofnod returned two records of otter within 1km of the site between 2016 and 2019. It is therefore concluded that otter are absent from the site but are potentially present within land 170m away.

Reptiles

- 3.2.31 The semi-improved grassland lacks structural heterogeneity and topographical variations, and thus does not offer optimal habitat for reptiles. However, with more suitable management the grassland has the potential to support reptiles in future. There are areas of brash and hibernacula located about the site and an embankment adjacent to the north which provides potential basking sites. Therefore, the site offers sub-optimal habitat for reptiles such as common lizard, grass snake, slow worm and adder for basking, foraging and sheltering.
- 3.2.32 Cofnod returned two records of slow worm and adder, one record of grass snake and common lizard 334m – 1km of the site. No sign of any reptile activity was found on site during the survey, although sightings are rare even in suitable habitat and the survey timing was outside of the core active season. It is therefore concluded that reptiles are potentially present on site and within surrounding land.

3.3 Notable Species

- 3.3.1 Cofnod returned one record for stoat and weasel, three records for hedgehog and one record for brown hare 500m – 1km of the site. The proposed development site has the potential to support hedgehog within the hedgerow and scrub habitats. Hazel dormice were considered unlikely to be present, due to the limited amount of hedgerow and the lack of hazel within the woodland, therefore this species is not reported on further.
- 3.3.2 No notable or locally rare species of flora were recorded on site, and given the lack of suitable land management, no such species would be likely to be present. There are no records of any such species within 1km of the site.

3.4 Invasive Species

- 3.4.1 There were no invasive non-native species (INNS) of flora recorded during the site walkover.
- 3.4.2 Cofnod return records of Himalayan balsam within 504m to the southeast of the site and of Japanese knotweed ~640m to the southwest of the site.

3.5 Key Ecological Receptors

3.5.1 The extended Phase 1 Habitat Survey has identified the following key ecological receptors associated with the site:

- WIE LWS / GCN; the species is known to be present locally and should be assumed as present within suitable habitat. It is therefore possible that GCN would be present within semi-natural habitats on site. *Local Value*
- Bats; there is Low BRP associated with two trees within the site boundary, but bats were not found during dusk surveys. *Local Value*
- Nesting Birds; there is the potential for small numbers of nesting birds to use trees and hedgerows on site and there are limited foraging opportunities present. *Local Value*
- Reptiles; the site offers sub-optimal habitat for reptiles, but is surrounded by other suitable habitat, therefore there is a risk that reptiles might be present on site. *Local Value*
- Notable Species; site offers suitable habitat for invertebrates and hedgehog. *Local Value*

3.5.2 The protected species / ecological receptors not bullet-pointed above are considered to be of *less than local value*.

4 DISCUSSION

4.1 Proposed Scheme

The Development

4.1.1 The potential development proposal outline scheme is illustrated on **Figure 2**, detailed within the feasibility plan and is summarised in the following bullet points:

- Develop the site for a storage and distribution unit.
- Creation of a new shared access off Bridge Road North.
- Creation of suitably sized yard with a turning circle and car parking.
- Reinstatement of semi-improved grassland and other semi-natural habitats to occupy a third of the application size footprint.

4.2 Likely Impacts

WIE LWS / GCN

- 4.2.1 The proposed development will result in the permanent loss of ~1ha of semi-improved grassland and scrub to the footprint of new building and made-ground. There would also be the temporary loss of ~0.5ha of semi-improved grassland, scrub and tall ruderal vegetation during the construction phase. These habitats are likely to be used by GCN and other amphibians, listed under the WIE citation.
- 4.2.2 Post-development, the scheme would reinstate and enhance the ~0.5ha of semi-natural habitats temporarily impacted, with details of the proposed habitat assemblage provided in Section 4.3 below.
- 4.2.3 The construction phase of the proposed development poses the risk of direct harm and disturbance to GCN and other amphibians, as well as temporarily impacting amphibian dispersal and connectivity across the site. These impacts are considered to be significant at the locale scale due to the significant size of the amphibian populations supported by WIE LWS and the unfavourable condition of this LWS. A GCN Development License will be required in order to develop the site.
- 4.2.4 Post-development the scheme has been designed to provide approximately one third of the site area for ecological enhancement and long-term management (consistent with approved development on adjacent land to the west). The retention, enhancement and long-term conservation management of this area of land is considered to be appropriate in terms of ensuring no net loss in habitat quality, value or functionality to GCN, other amphibians and other biodiversity interests in general.

Bats

- 4.2.5 The proposed scheme will result in the loss of Trees 1 and 2. Roosting bats have been confirmed as absent from these trees at the time of survey. However, suitable features for roosting bats remain. There is a risk that the future removal of these trees could directly impacts bats.

- 4.2.6 The proposed scheme will result in a net loss of habitat area for foraging and commuting bats, with two-thirds of the site being lost to the building and made-ground. However, the retained third of the site footprint will be enhanced to compensate for the loss in habitat area.
- 4.2.7 Artificial lighting from the proposed development also has the potential to affect bats post-development. Measures to minimise and mitigate the potential impacts of artificial lighting should be implemented.

Nesting Birds

- 4.2.8 The scheme will result in the permanent loss of a small area of scrub and both trees to facilitate the development footprint. These areas are considered to be of low value to nesting birds, therefore the permanent impact will be minor. There will also be a loss of foraging habitat in the form of the 1ha of semi-improved grassland that is permanently lost. However, these losses will be offset by the proposed habitat retention, enhancement and long-term management as described in Section 4.3.
- 4.2.9 There will be a risk of direct harm to nesting birds, their eggs and chicks if vegetation clearance is undertaken during the nesting bird season (March to August inclusive).

Reptiles

- 4.2.10 The scheme will result in the permanent loss of 1ha of sub-optimal habitat for reptiles, and the retention, enhancement and long-term management of 0.5ha of similar habitat. The scheme also poses a risk of direct harm and disturbance to any reptiles present within the development footprint during the construction phase.

Notable Species

- 4.2.11 The proposed scheme will result in a loss of semi-natural habitat of relatively low value to notable species including hedgehog and invertebrates. There is a risk of harm and disturbance to notable species during the construction phase. However, 0.5ha of the site is allocated for ecological mitigation and will be enhanced and managed long-term to deliver ecological benefits for notable species.

4.3 Recommendations

WIE LWS / GCN

- 4.3.1 The proposed development will need to be undertaken under a GCN Development License, obtained from Natural Resources (NRW) upon the grant of any planning consent. No physical works of any description should take place in site until such time as the GCN License is obtained.
- 4.3.2 The following mitigation strategy will be followed and will be detailed within the GCN License Application:

Trapping / Translocation

- Installation of GCN exclusion fencing, to industry standard, around the perimeter of the red-line application site boundary. The access off Bridge Rd North will remain open, with the GCN fence aligning the edge of the hard-standing to the east of the Coolpoint building.

- Install pitfall traps and artificial refugia at alternate 10m intervals.
- Undertake a minimum period of 30 trapping days, with the option to increase the trapping if the catch rate has been higher than anticipated. This is on the basis that although the WIE GCN population is large, the site is relatively small and comprises mainly semi-improved grassland of relatively low value. If the capture rate within the initial 30 days exceeds 10 GCN, then the capture effort will be extended to 60 days.
- Trapping effort will take place under suitable weather condition during the period March to October inclusive, i.e. whilst overnight temperatures do not fall below 5°C.
- All GCN and other amphibians caught during the trapping effort will be moved into suitable habitat on the embankment adjacent to the north of the site. This land is under the control of the applicant / licensee.
- Following completion of the trapping effort, all traps and refugia will be removed and construction works will be allowed to commence. A new site access will be created to the north of the existing, which will be used during construction.
- The GCN fencing will be subject to weekly audits by the principal contractor and monthly audits by the GCN-licensed ecologist. Any damage will be fixed within 24 hours of being identified.

Habitat Enhancements

- The proposed habitat enhancements have been indicated on Plate 4.3.1 below.
- Species-rich native hedgerows will be planted along the east and west boundaries. These will comprise a minimum of five native species, planted in two rows (300m apart) with centres staggered at 300mm. These hedgerows should be fenced with post and wire fencing to form 1m wide corridors. Two English oaks will be planted within the hedgerow and will be managed as hedgerow standards, to replace the two oaks to be lost to the development.
- The semi-improved grassland will be reinstated across the entire ecological area as shown on the proposed layout plan. Existing topsoil will be retained and stored appropriately on-site during construction and then used as part of the grassland reinstatement. Topographical variation will be created across the grassland to offer niche habitats in terms of temperature, wetness and aspect.
- A cluster of five native broadleaved trees will be planted at the northern end of the site, comprising two silver birch, two alder and one rowan.
- Four hibernacula will be created on site to provide suitable sheltering and over-wintering opportunities for amphibians.
- All of these features will be subject to long-term habitat management as described below.

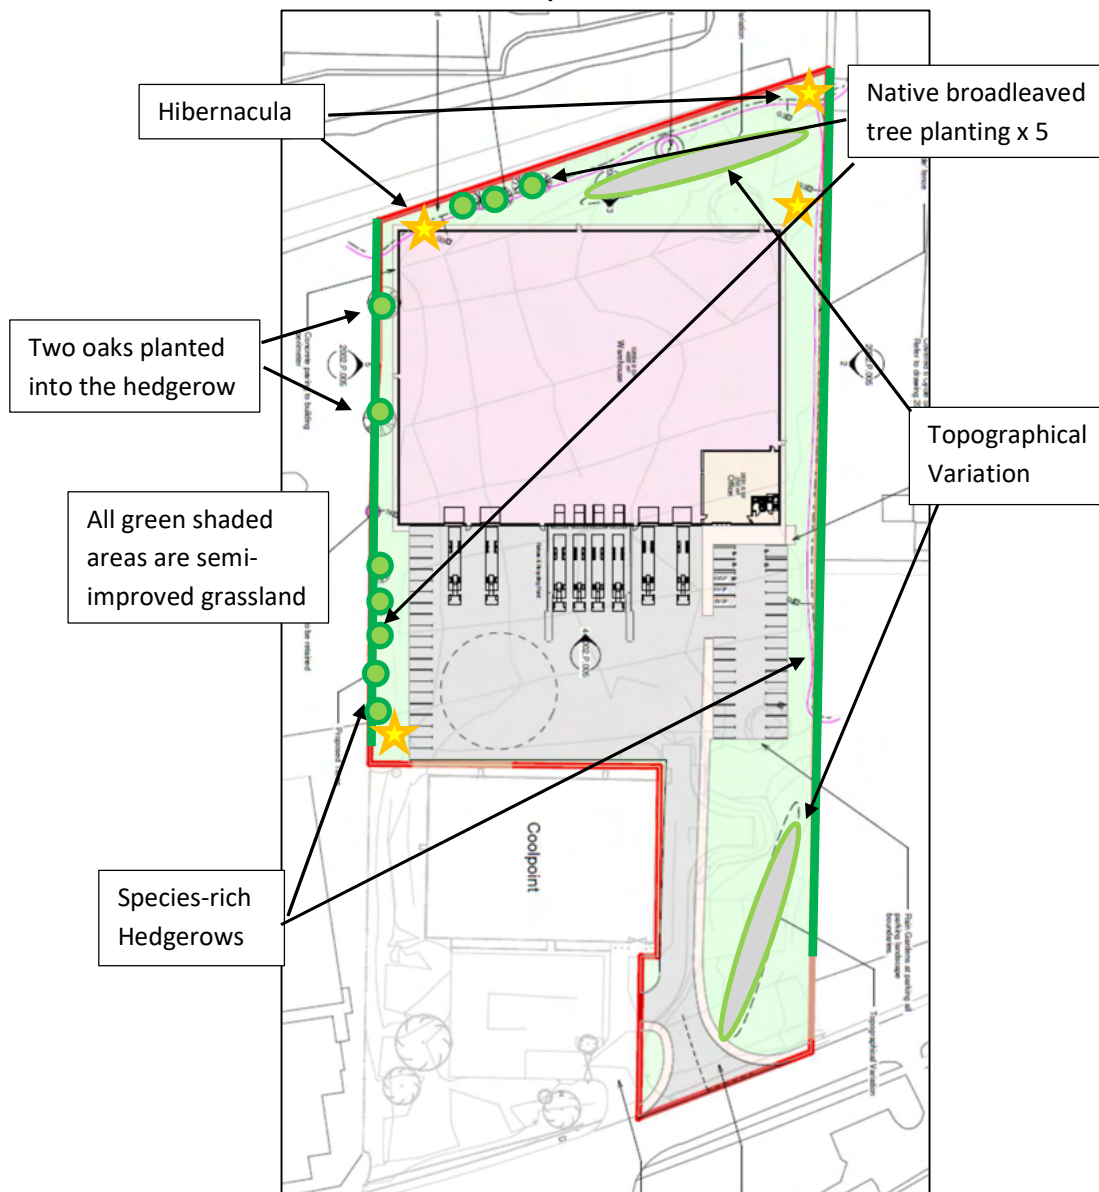

Long-Term Management/Monitoring/Maintenance

- The site will be subject to a minimum 25-year Habitat Management Plan, secured as part of the GCN License.
- Newly created and existing hedgerows will be managed annually, and hedge-bottoms left un-cut to allow a dense ground flora to develop. Hedgerows will be laid after 10-15 years to further enhance their biodiversity value.
- Semi-improved grassland will be subject to an annual cut to 150mm by strimming, with all cuttings raked off and collected.
- Pockets of scrub and tall ruderals will be allowed to establish (by not cutting) in several locations, to offer habitat heterogeneity.

- Hibernaculum will be maintained by replenishment using grass clippings and hedgerow trimmings from site management.
- All of these features will be subject to ecological monitoring, in Years 1, 2, 3, 5, 10, 15 and 25 post-development.
- The GCN license will be linked to the ownership of the site. In the event of the site being sold, the license would be transferred to the new owner. The licensee will be solely responsible for the implementation of the GCN License requirements, including habitat management, monitoring and maintenance.

4.3.3 The operation of the site also has the potential to cause harm to GCN and other amphibians through the use of traditional gully pots and surface water management. To avoid this long-term risk to amphibians, it is recommended that all gully pots installed on site are amphibian-friendly, by using either dropped kerbs or recessed kerbs, to prevent amphibians from becoming entrapped.

Plate 4.3.1 Proposed Habitat Enhancements

Bats

- 4.3.4 It is recommended that climb and inspect surveys by a suitably experienced and bat-licensed arborist are undertaken on the two oak trees immediately prior to felling. In the unlikely event that bats are found to be present, then further surveys and an EPS Bat License will be required. If no bat roosts are found, the trees will be felled immediately.
- 4.3.5 It is recommended that no artificial lighting be installed on the norther, eastern or western elevations of the new building. This is to avoid impacting bat flight along the boundary corridors. Any lighting installed on the southern elevation should be angled such that they cast light only onto operational areas. No lighting is to cast beyond the extent of made-ground / hard-standing.

Nesting Birds

- 4.3.6 It is recommended that any vegetation clearance work is undertaken outside of the nesting bird season, i.e. vegetation should be removed during the period September to February inclusive. Where this is not possible, any clearance work undertaken during the nesting season must be preceded by a nesting bird survey undertaken by a suitably experienced ecologist. Only those areas of the site where no active nests are present will be available for clearance during the nesting season.

Reptiles

- 4.3.7 The proposed mitigation strategy outlined for GCN will be an effective method for the safe capture and translocation of reptiles from the development footprint prior to the start of construction. Any reptiles found during the capture effort would be carefully translocated into land adjacent to the north (also owned by the applicant).

Notable Species

- 4.3.8 It is recommended that the site is cleared with care to avoid direct harm to hedgehogs. Some of the impacts on invertebrates will be unavoidable but will be offset in the long-term by the habitat restoration and long-term management as described above.

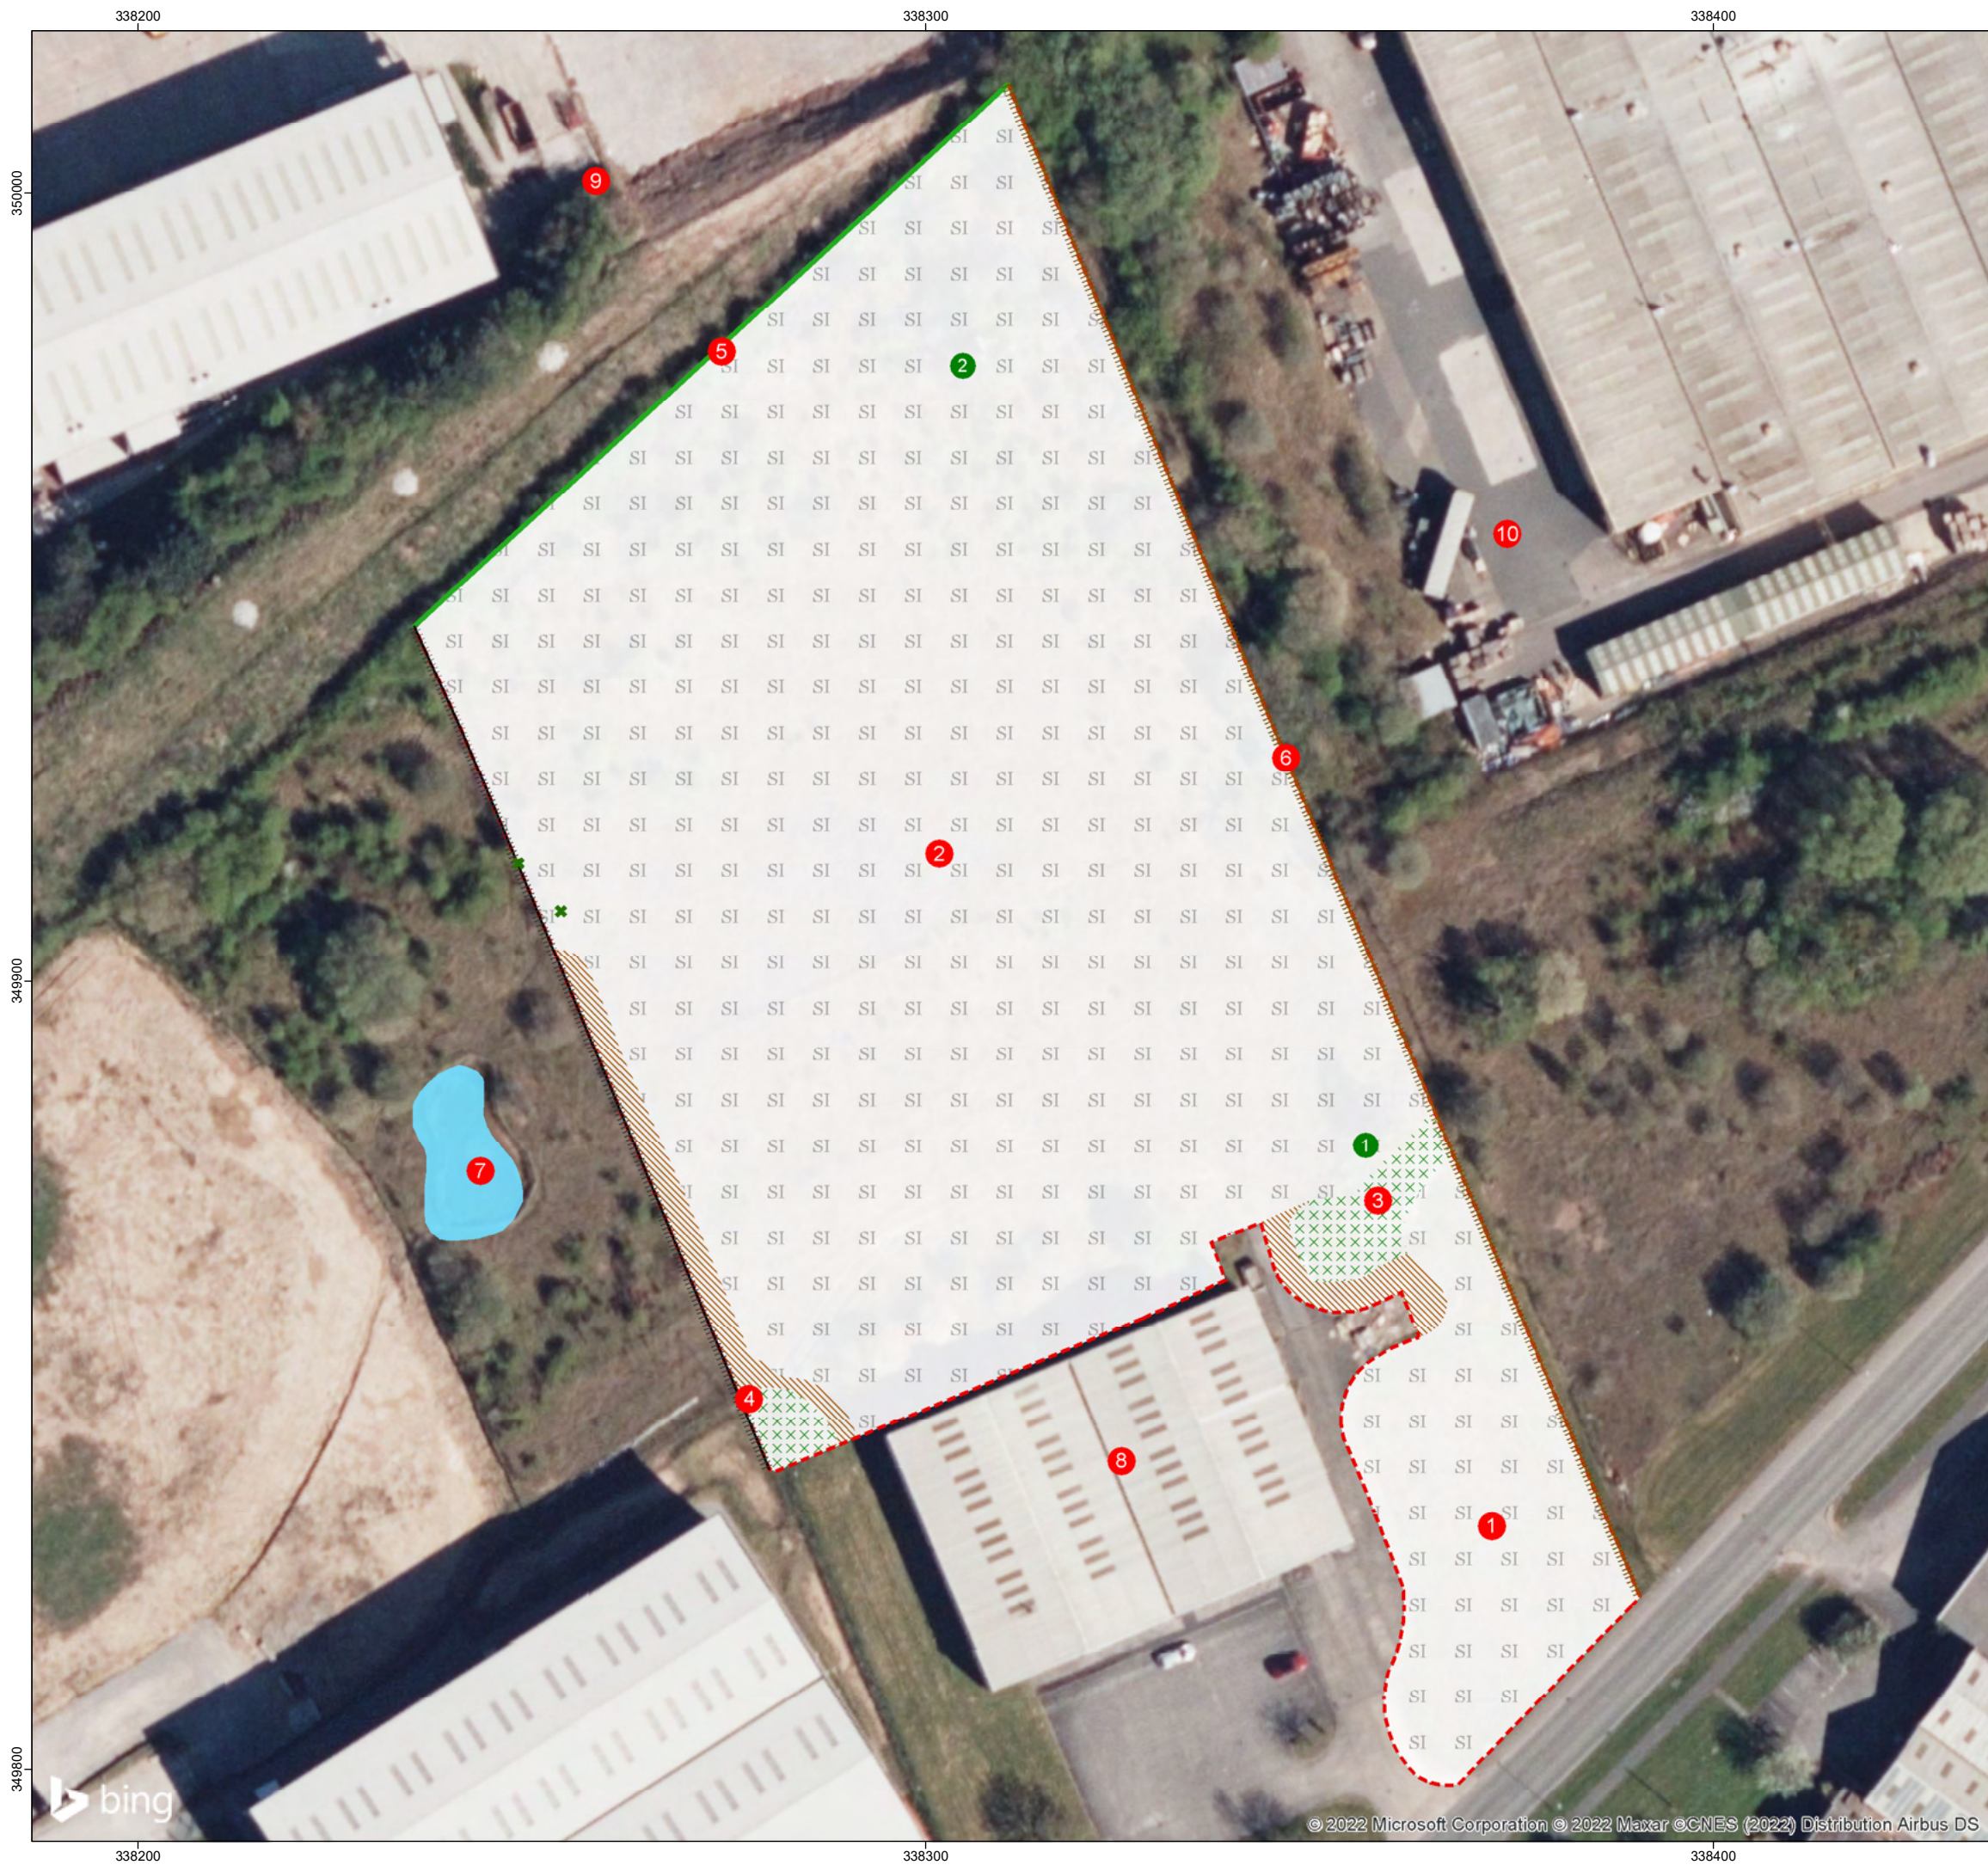

5 CONCLUSION

- 5.1 Etive Ecology Limited was commissioned by Caulmert Ltd to undertake an ecological appraisal of a plot of land off Bridge Road North, Wrexham Industrial Estate. The site is proposed for a single storage and distribution unit.
- 5.2 The assessment comprised an Extended Phase 1 Habitat survey, a desk study, bat detector surveys, an assessment of the likely impacts on the ecological value of the site and recommendations for further survey and/or mitigation measures to be implemented.
- 5.3 A desktop data search identified that there are no statutory designated sites for nature conservation located within 1km of the proposed site. There is one Local Wildlife Site (LWS) located within 1km of the proposed site; Wrexham Industrial Estate LWS. There are also three blocks of Ancient Woodland <500m of the application site. Protected species records provided by Cofnod include GCN, numerous bird species, bats, badger, otter, brown hare and hedgehog. Previous ecological studies in the area have confirmed the presence of GCN.
- 5.4 The site is located in the southern part of WIE, surrounded by other industrial units and plots. The site is ~1.5ha and comprises semi-improved neutral grassland, a native species-poor hedgerow, two scattered trees and small areas of scattered scrub and tall ruderal vegetation. The surrounding land-use is industrial in all directions for ~1km. There are five ponds located within 500m, the closest of which is a relatively new pond constructed 10m to the west of the site as GCN mitigation for the recent development thereon.
- 5.5 The site has the potential to support GCN, reptiles, nesting birds and notable species such as hedgehog and invertebrates. The two trees on site were both assessed to be of Low BRP and were subject to a single bat detector survey in May 2022, with no bats found to emerge from either tree and overall bat activity on site found to be very low.
- 5.6 The proposed scheme is for one storage and distribution unit with associated parking and yard area. A new access off Bridge Road North is to be created. The scheme has been designed so that two-thirds of the site are developed and one-third is provided for ecological mitigation. The ecological area includes the creation of 200m of species-rich native hedgerow, 0.5ha of semi-improved grassland and four hibernacula. All of these features are to be subject to a minimum of 25 years conservation management. Due to the location of the site within WIE LWS, the scheme will need to be implemented under a GCN Development License. An outline of the proposed approach to mitigation has been provided herein, with full details to be provided as part of the GCN License application.
- 5.7 In conclusion, the application site has been found to be of low ecological value, with the low potential to support a number of protected and/or notable species. Detailed mitigation is likely to be required in relation to GCN, including detailed design of habitat creation and landscape planting. The proposed scheme is anticipated to result in a small biodiversity net gain in the long-term, as a result of long-term site management.

Appendix A - Figure 1

Phase 1 Habitat Map

This page is intentionally blank

Survey Information	
	Site boundary
Phase 1 Habitat Survey	
	Scattered scrub (282.5m ²)
	Poor semi-improved grassland (13,810.7m ²)
	Tall ruderal (359.4m ²)
	Pond (offsite)
	Species poor native hedgerow (102.1m)
	Fence - wooden (208.0m)
	Fencing - metal Heras fence (116.1m)
	Scattered tree
	Scattered scrub
	Target note

Additional Information:
Please see associated report for further information relating to each target note location.

The Pond is 14.68m from the site boundary

1

PROPOSED SITE PLAN

1 : 500

ECOLOGICAL MITIGATION

Gross Site Area	15,105m2
Area of Mitigation (shown green)	4,696m2 (31% of application area)
Developed Area	10,410m2 (69% of application area)
Building Footprint	5,210m2
Hardstanding	5,200m2

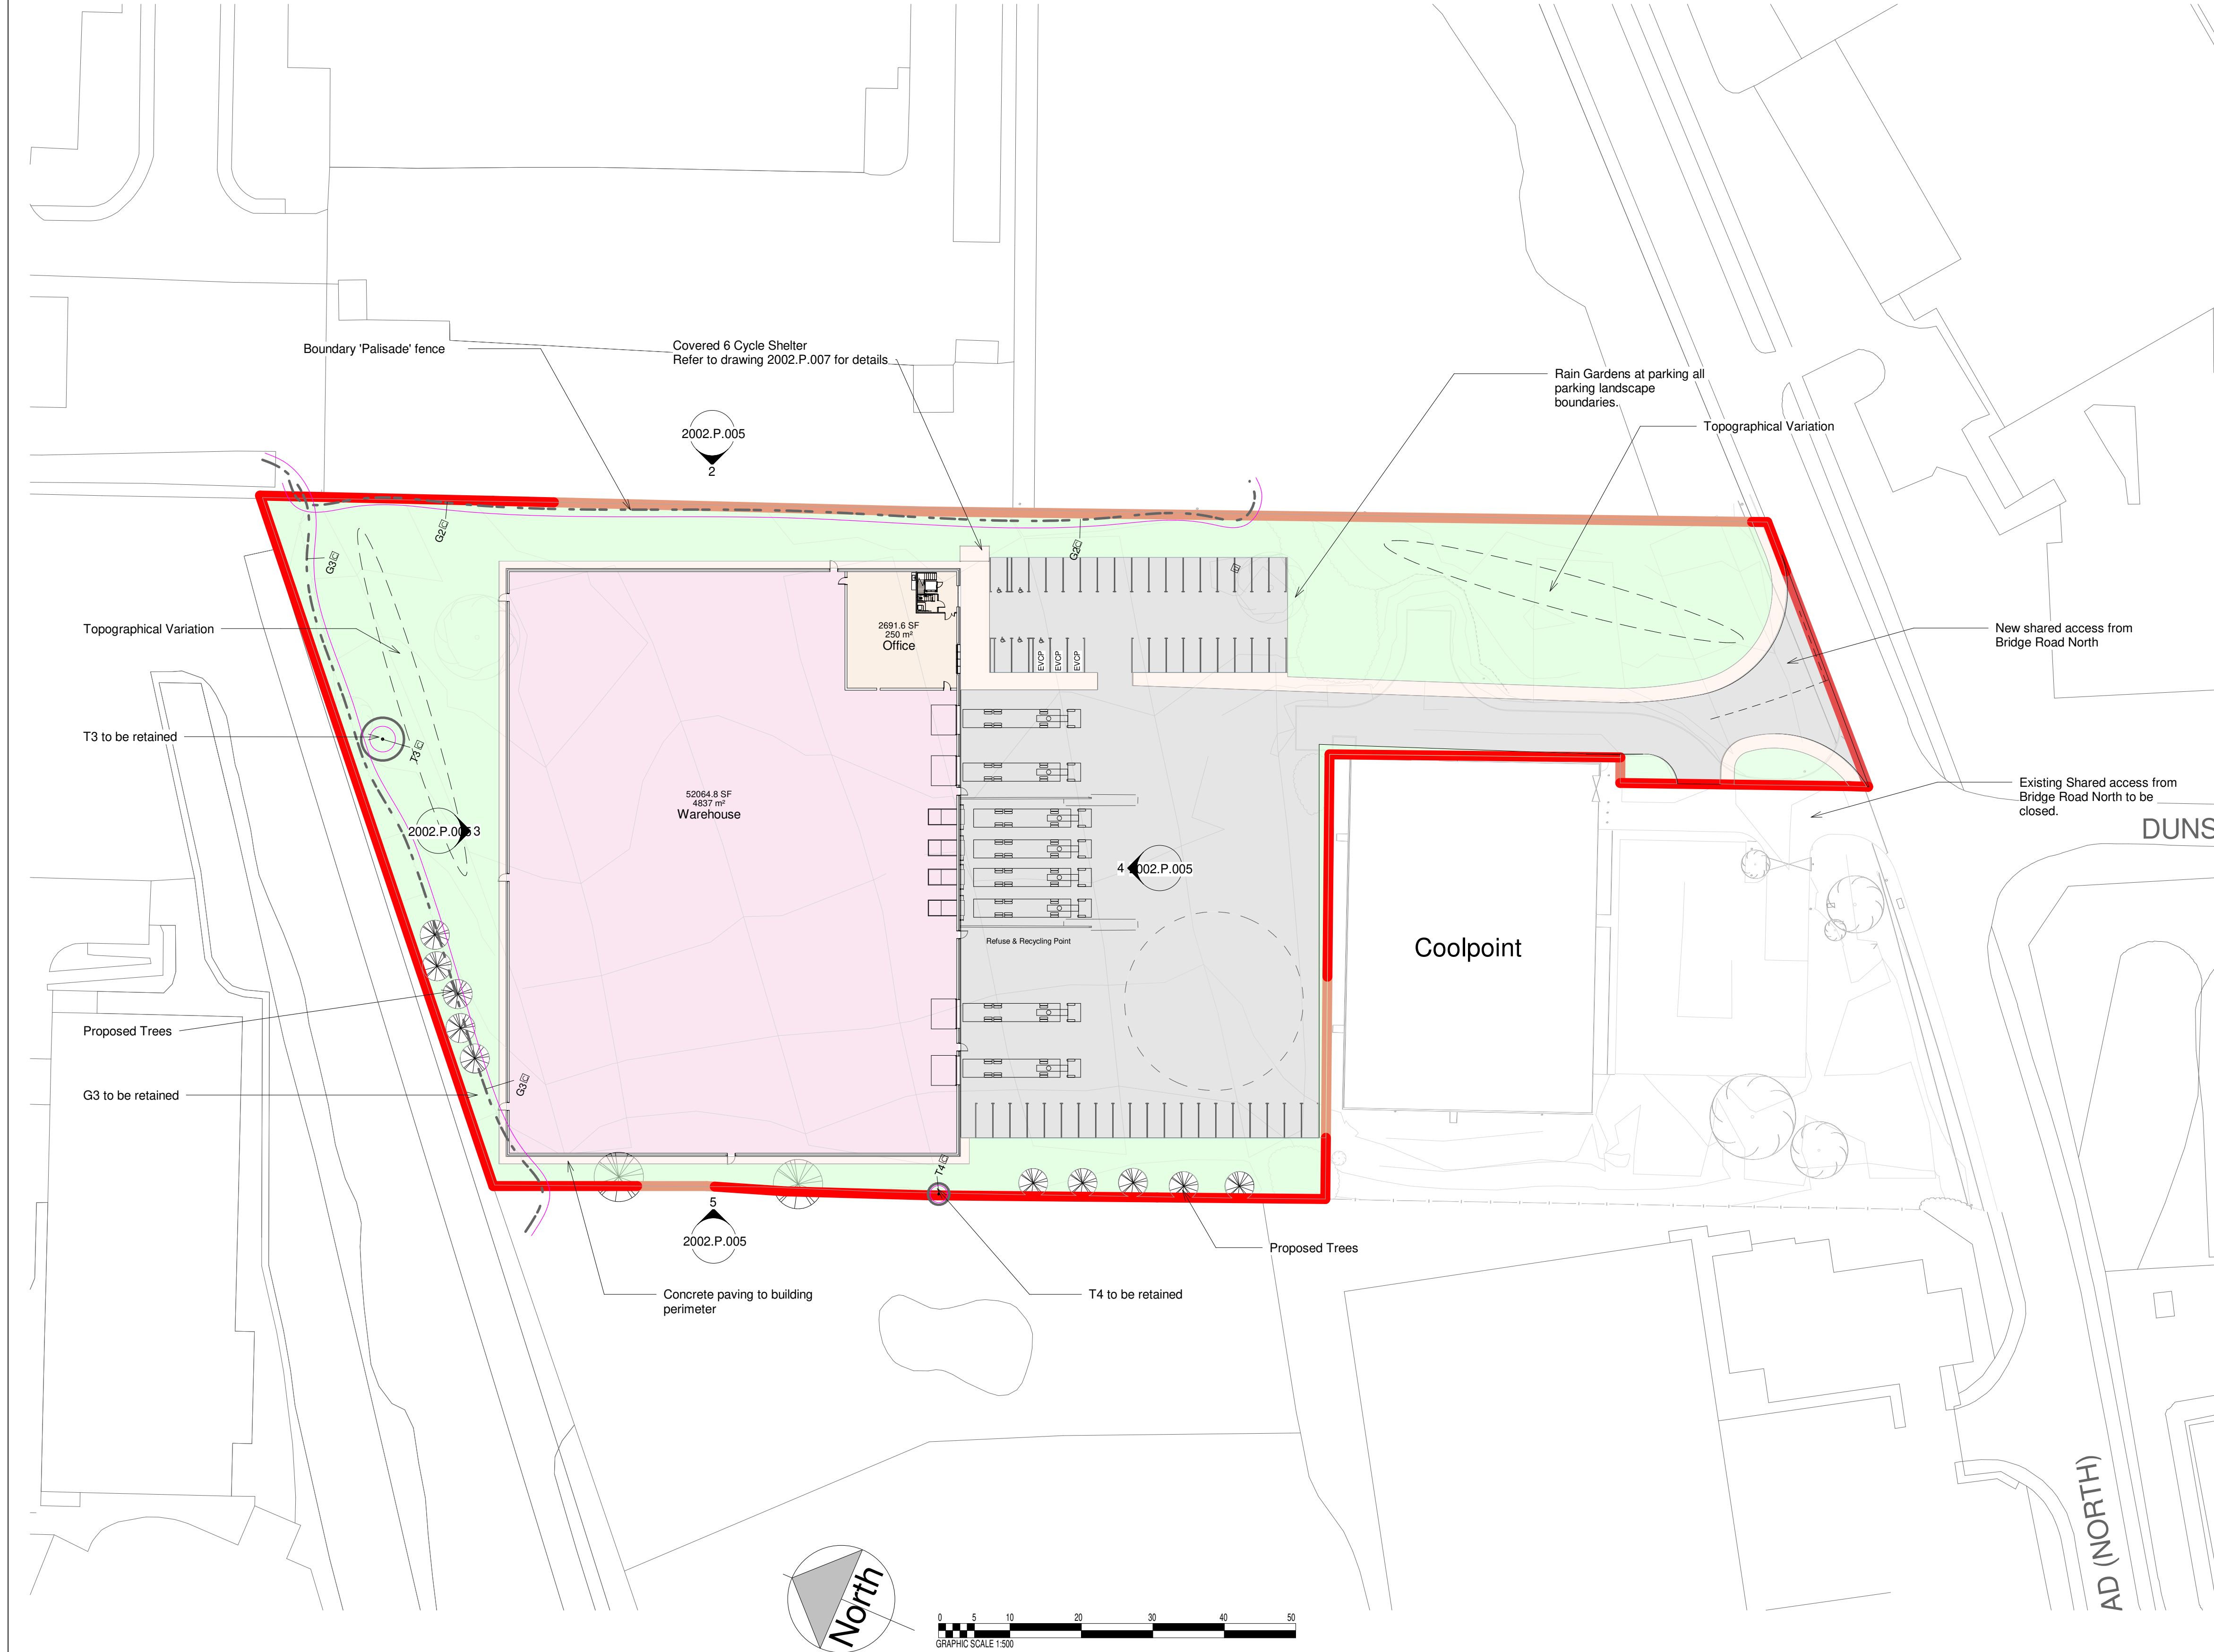

PARKING PROVISION

UNIT 1	Gross Internal Area	5,087m2
Parking Provisions		
Car Parking Bays	51 Total spaces (average 1/100m2)	
Disabled Bays	5 spaces (10% of Provision)	
Cycles	6 sheltered spaces	

1. This drawing has been produced for the client for the project on the site shown. It was prepared for a purpose agreed with the client and will have a commensurate degree of accuracy.
2. This drawing is not intended for use by any other person or for any other purpose without express permissions.
3. Pace Architecture Limited accept no liability whatsoever if this drawing is used by any other person or for any other purpose.
4. Do not scale from this drawing. All measurements to be checked on site.
5. Report to the Architect any discrepancies or information requiring updated.
6. CDM (2015) - All designers have a duty to review, identify and circulate health and safety risks when apparent.
7. Under CDM (2015) Pace Architecture Ltd assumes the role of 'Designer', unless otherwise appointed in writing by the client.
8. If in doubt ask.

Cofnod Environmental Information Search (PUBLIC VERSION)

Our Reference	CO/E09704
Your Reference	Bridge Road
Requested By	Wendy O'Neill, Etive Ecology
Data Users	Wendy O'Neill and Russell Grey
Search Date	11/02/2022 14:05
Expiry Date	11/08/2022 (may be extended on request)
Search Type	Chargeable

Important Information

- Use of the data is governed by Cofnod's [Terms & Conditions](#).
- Data marked as confidential or sensitive must not be released into the public domain, with the exception of the Public Version of the PDF report, which has had sensitive information removed or restricted.
- You should not amend any part of the downloaded records.
- Unless otherwise agreed, use of the data is valid until the Expiry Date (11/08/2022).
- Past records of presence of a habitat or species do not guarantee continued occurrence; absence of records does not imply absence of a species, merely that no records are held by Cofnod; Cofnod cannot guarantee the accuracy of supplied data; copyright of records remains with the original recorder.
- The Dataset ID associated with each record can be used to find information about the provenance of the data. See the [Cofnod Metadata](#) page for more information.
- Verification Levels are given for each record and indicate whether the record has been assessed by an expert.
- Please [contact us](#) if you have any questions about using the data or wish to add further Data Users.

Notes

- Records with 1km, 2km, 5km, 10km or 100km grid references (where present) are highlighted with, for example, (1km) next to the distance to indicate that the distance

should not be considered to be exact given the vague nature of the grid reference.

- Records shown in **bold** typeface are sensitive species records, and some details have been restricted in this public version of the report.

Verification Levels

- **UA**: Unassessed
- **PC**: Probably Correct
- **KC**: Known Correct
- **NA**: Not Required

Species Categories

- **All Other Species**: Any species not included in other categories
- **Category 1 Species**: Species with European and/or UK Legal Protection, Section 7 Species or UK BAP Priority Species
- **Category 2 Species**: Global Red List, British Red Data Book, Nationally Rare & Scarce, Welsh Red and Amber Birds & Welsh Vascular Plant Red Data List, not identified in Category 1
- **Category 3 Species**: LBAP Species not identified under Categories 1 & 2, Locally Important species as specified by local experts

- PUBLIC VERSION -

Data Description

Distance	Indicates the distance, in metres, between the grid reference of the record (using the central point of the grid square) and the search location. For any Sensitive Species Records, this should not be released into the Public Domain.
Species Name	Name of the taxon (usually identified to species level) using the binomial system.
Date	Date on which the record was made. In some cases this might be a date range, or a vague date such as 'Summer 2010'.
Recorder(s)	One or more people who made the original observation and recorded it in some way. It may have subsequently been included in a data collation by another person or it may have been submitted to the LERC directly.
Abundance	Number of individuals recorded. Where not specified it is assumed that at least one was present.
Record Type	A description of the type of record.
Site Name	The site name (if one has been supplied). For any Sensitive Species Records, this cannot be released into the Public Domain.
Notes	Any additional notes about the sighting. For any Sensitive Species Records, this cannot be released into the Public Domain.
Dataset ID	ID of this dataset. See 'Important Issues' for more details.
Lists	Any local, national or international conservation statuses or legal protection which apply to this species and whether it is included in any Local Biodiversity Action Plans. See 'Abbreviations' for more details.
V	An indicator showing the level of confidence held in the record's correct identification.

Dataset Information

The records in these results are drawn from the following datasets. Use the Dataset ID next to each record to find its dataset.
