

Dear Sharon Williams,

Thank you for replying so promptly.

Attached is a map of the two fields with a scale at the bottom.

The green hatched area on the top right hand edge of the SSSI field is where the land was levelled and was reseeded June and early July. This area was formally thick with nettles and some docks so I will control their regrowth with slashing and spot spaying with selective broad leaf herbicide.

The red rectangle represents where the shed was originally constructed. When this is removed the spot of land directly where the shed currently stands will be re-sown with local grasses particularly with seeds from local hay. We may be able to sow this patch this autumn and or next springtime.

Please get back to me if you have any questions.

Kind regards

Robin
