

P/2020/0869 Lodge farm LL13 9TE

The micro brewery hopes to operate seamlessly within the current agricultural business by taking the grain from the land, brewing it in a redundant grain bin, using heat and electric from the farms Anaerobic Digester and returning any wastes back into the AD process. This exciting venture is possibly the only carbon neutral brewery in the UK

NRW,

With reference to your reply about the above application can I clarify a few points to put your mind at rest, the grain bin is on a farm next to a slurry lagoon (see attached plan) the cesspit box was ticked on the application due to the lack of one saying lagoon, I do not not intend to dig a cesspit or hole of any description and only intend to use the lagoon if there is a failure in the grain bin of one of the brewing tanks to catch any runoff, the normal day to day by-products of the brewing process get re used in the AD plant to create an environmentally friendly closed loop process, I hope this clarifies the situation and apologise for any confusion caused,

Regards

Jonathan Tomlinson
