

effect as water will come up drains from brook. The farm has always managed flood issues by means of a tractor driven pump.

Groundwork's in the building will be minimal there would not be any need to raise any floor levels the only raised level would be to form the cubicle beds in the top half of shed.

The lower half of proposed building would be used as young stock housing in winter and also machinery storage to replace old store so would require only a concrete floor and would not be adversely be affected by flooding.

Protected Species

I can confirm there are no Protected species on the proposed site as it is a concrete yard which is in constant use.

I hope this addresses all of your concerns

Peter Hughes
