Hi Craig

We're just revisiting our options regarding the relocation of the incoming electricity supply, should we go for the fully glazed gable end.

Could you take a look at the drawing sent to SP Energy showing where the supply connects to the building now, and how it might work higher up - and advise whether this would be permitted? SP Energy can do it, but we're not sure if it would meet with approval by Building Control.

It's worth noting too that currently, this is where the connection meets the building but it actually wraps around the outside and connects with the meter at the front of the building in the porch. Clearly if we were to have it moved up the wall we would need it to enter the building there, and be integrated internally.

Thanks for your thoughts,
Louise
