Plan to increase the bio – diversity in connection to the proposed installation of shed at Pen Y Cae.

Our aim is to increase the bio diversity around the area where we propose to erect the shed. We aim to do this by:

- Planting a hedgerow of native species including, oak, hazel, hawthorn , blackthorn and dogrose. The hedgerow will be planted to side of the shed to shield it from the rest of the field. This will increase the habitat for nesting birds, small mammals and invertebrates.

- Plant native tress in the area in front of the shed, which will, in time grow to form a small copse. The copse will be managed for the purpose of providing extra habitat for birds and small mammals in this area. As it grows it will also obscure the shed from the view of the rest of the field.

- We will manage the saplings that are already growing in this area and plant the new trees amongst them accordingly.

- Install nestboxes on the mature tress currently close to the shed location to maintain habitat for nesting birds in the season.

- Install bird feeders nearby to mitigate for any disruption to natural feeding habits whilst the shed is being erected.
