In regards to TPO Application, please see more information below :

Yew tree - Applied to fell due to leaning. Recent ground disruption could lead to health implications for the trees. (As noted on most recent tree report)
Also, the line of Conifers shall be being topped in the near future which may leave the Yew tree very exposed to wind.

Lime tree - Applied to remove epicormic growth
Epicormic growth needs to be removed from the base of the Lime tree to allow for further inspection for any defects

Horse Chestnut - Applied to target prune
Photograph submitted showing which branches we would like to cut to allow access.
Long, heavy weight lateral branches overhanging the access road, looking to reduce weight to eliminate future failure.

Large Horse Chestnut - Applied to fell
Has very large wounds on the trunk from previous pruning with cavities starting to hollow out the main stem.
Tapped several parts of the main stem, hollow sounds through a large section of the main trunk - being in a high used area with traffic underneath- we think the safest option would be to fell & re-plant 2 native trees
